HOW TO INSTALL

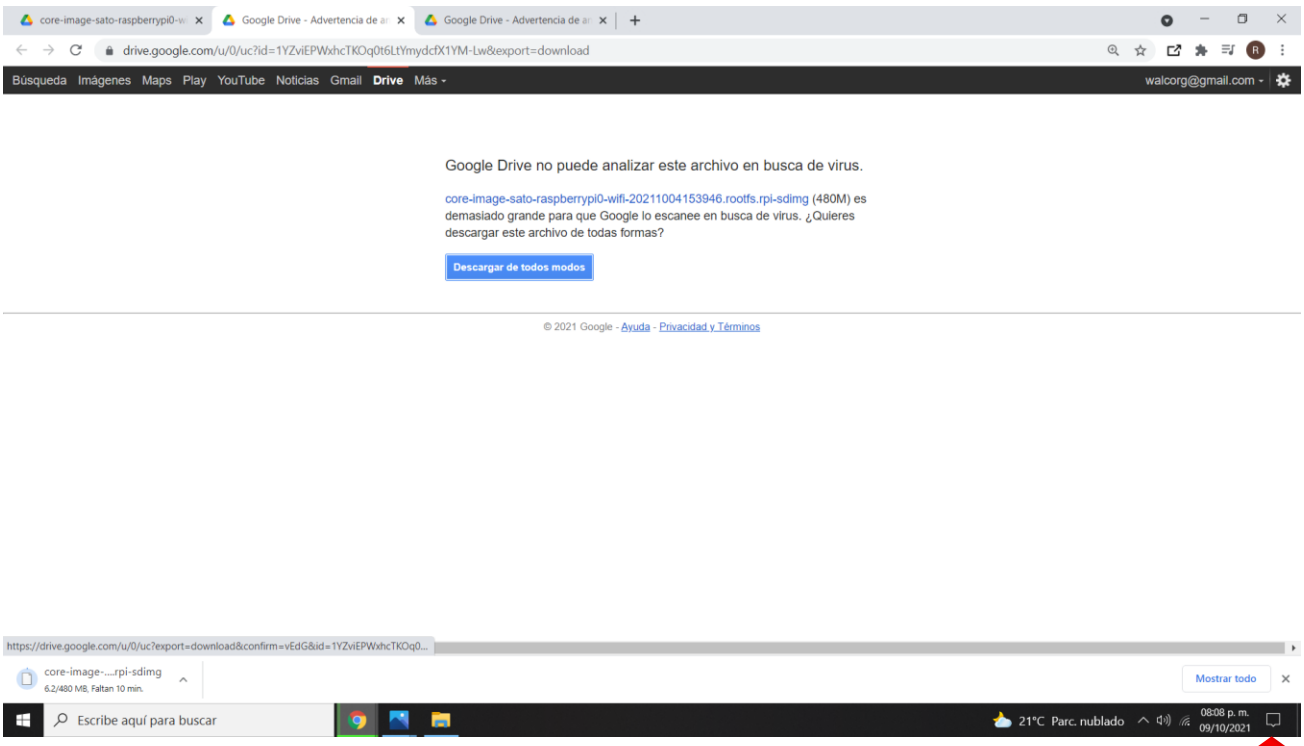

ON A MICRO SD

ALPHA TEST VERSION

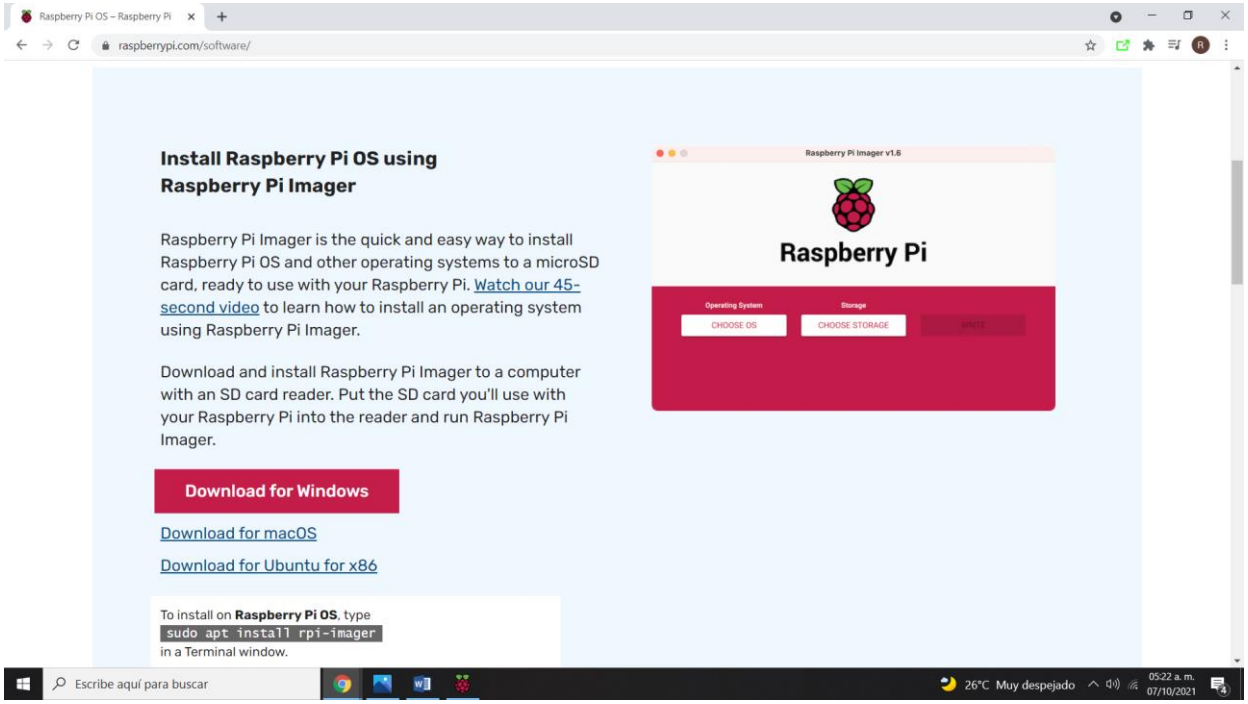

Go to www.walcorg.com and go to the DOWNLOADS section or make click on the follow link:
https://drive.google.com/file/d/1YZviEPWxhcTKOq0t6LtYmydcfX1YM-Lw/view?usp=sharing

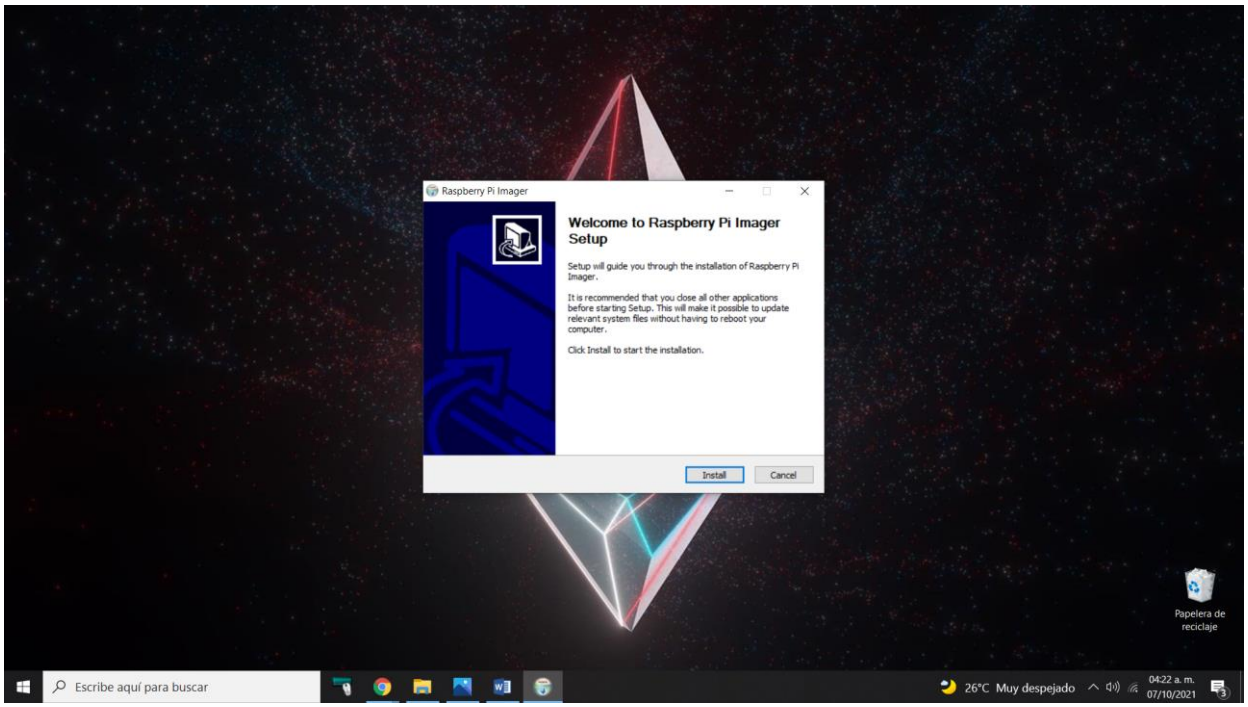

A new window opens, click on download file.

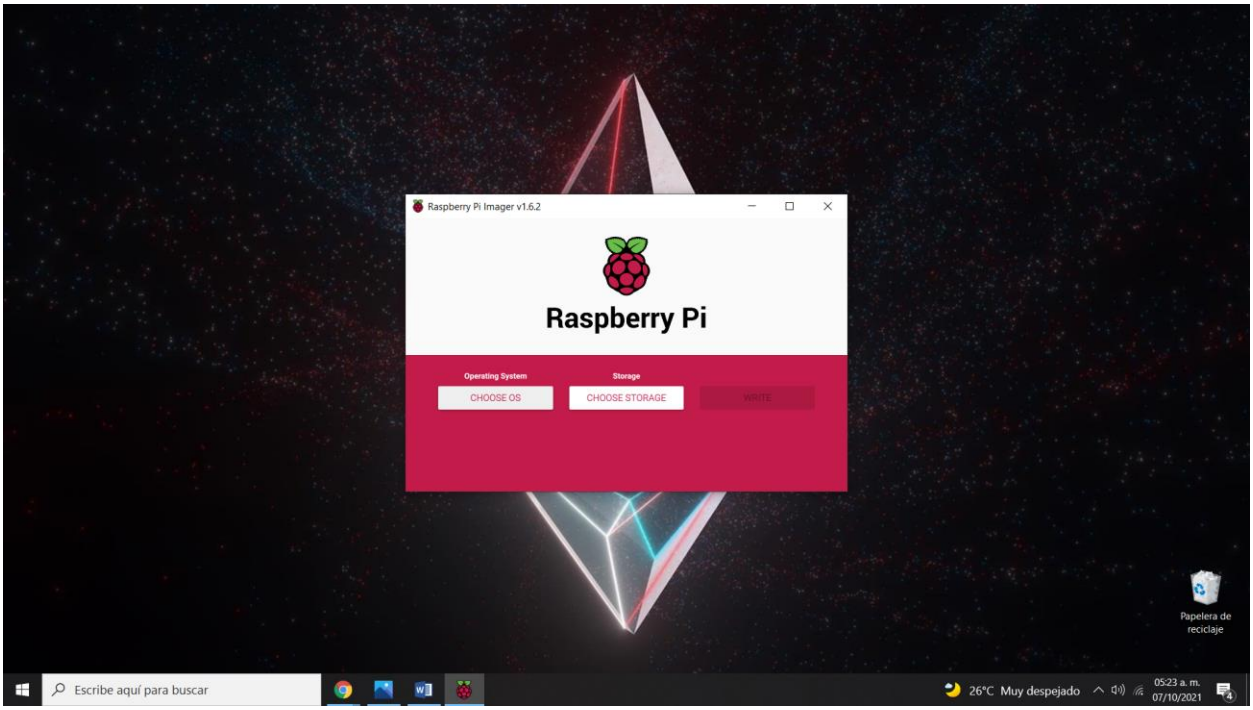

Please go https://www.raspberrypi.com/software/ and download RASPBERRY PI IMAGER.

Go to your downloaded files, locate RASPBERRY PI IMAGER and double click to start the installer.

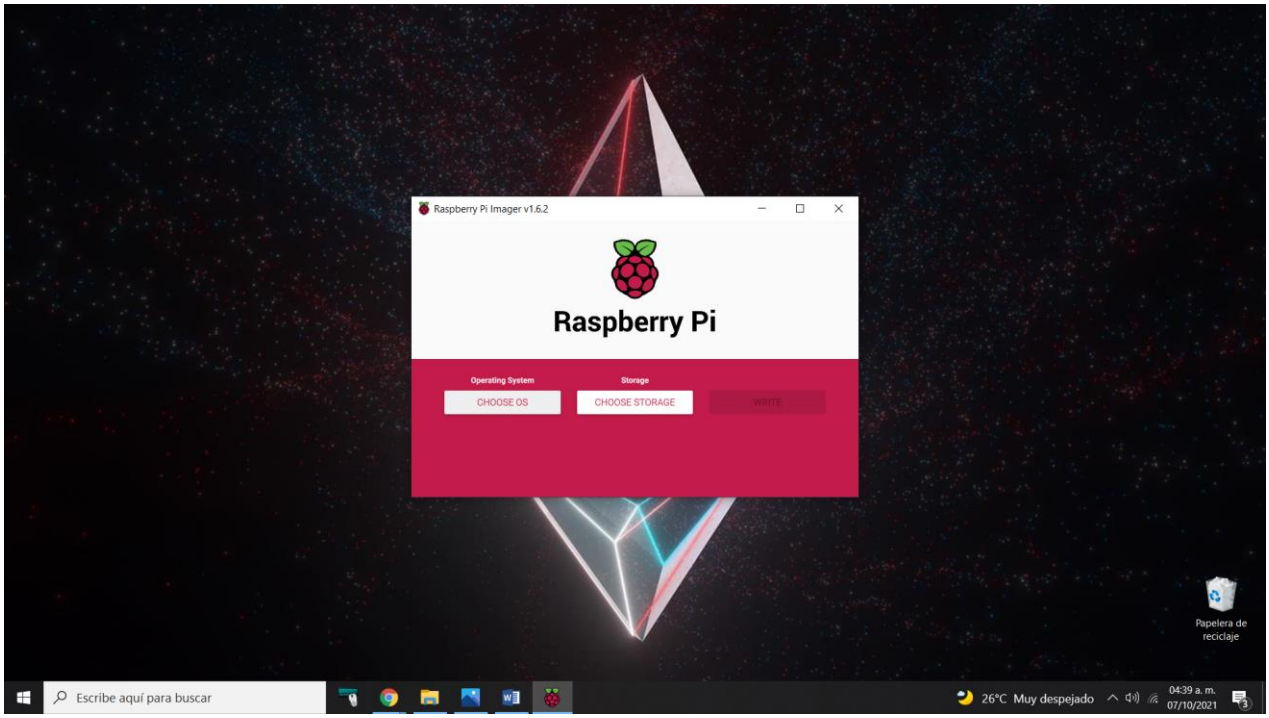

Open or start RASPBERRY PI IMAGER.

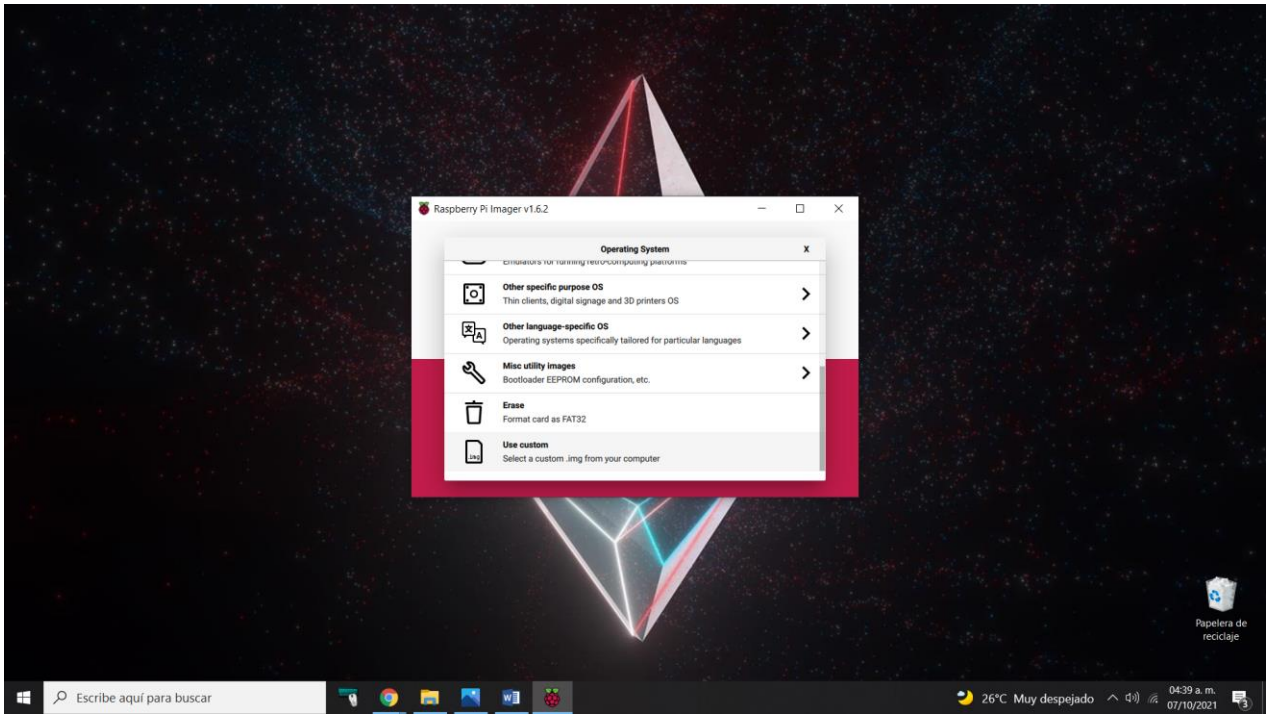

Connect a micro SD memory to your PC either directly, through an adapter or card reader.

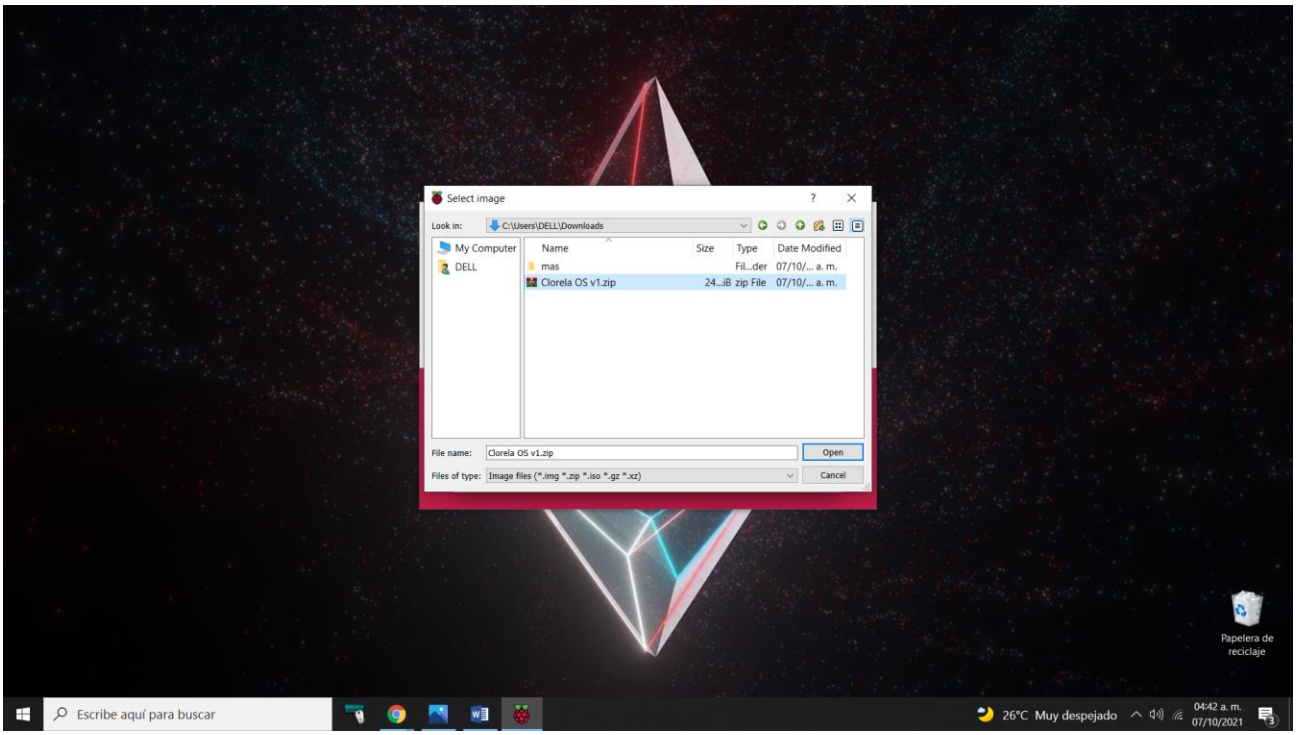

Click on CHOOSE OS.

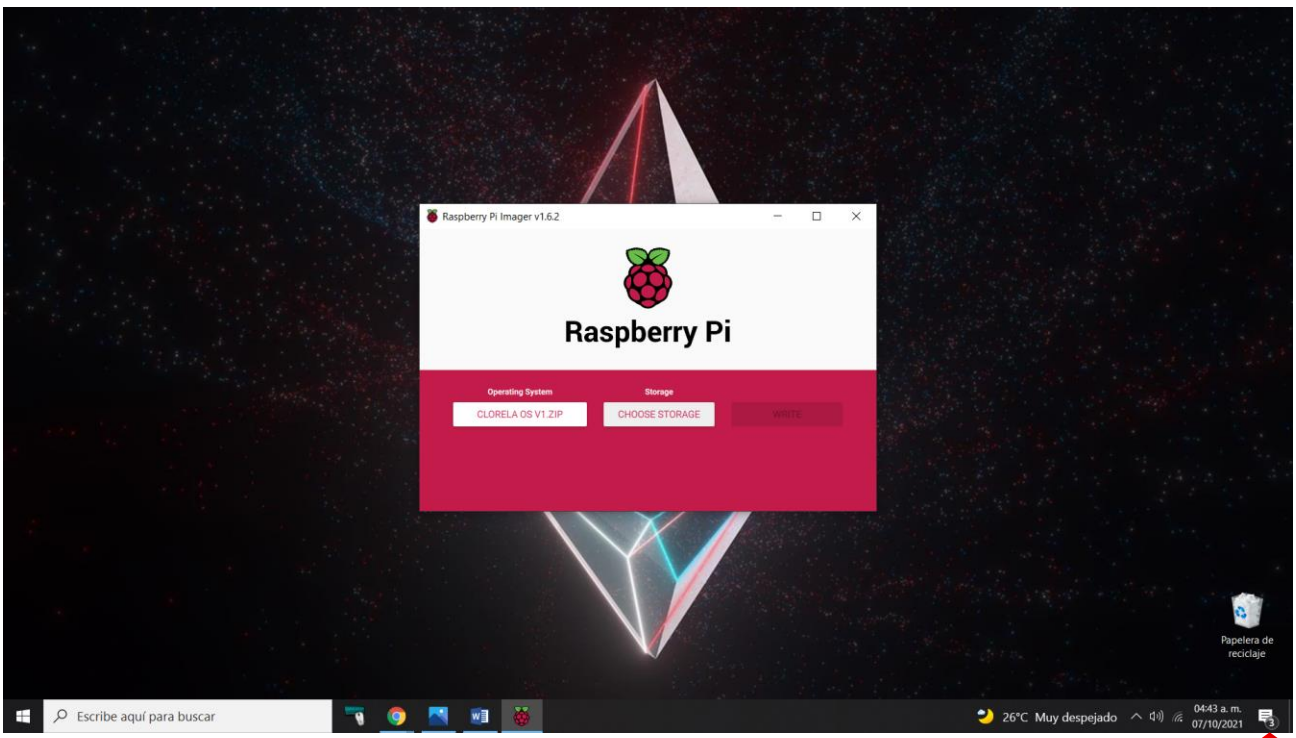

Go to the bottom of the dropdown menu that appears and click on USE CUSTOM.

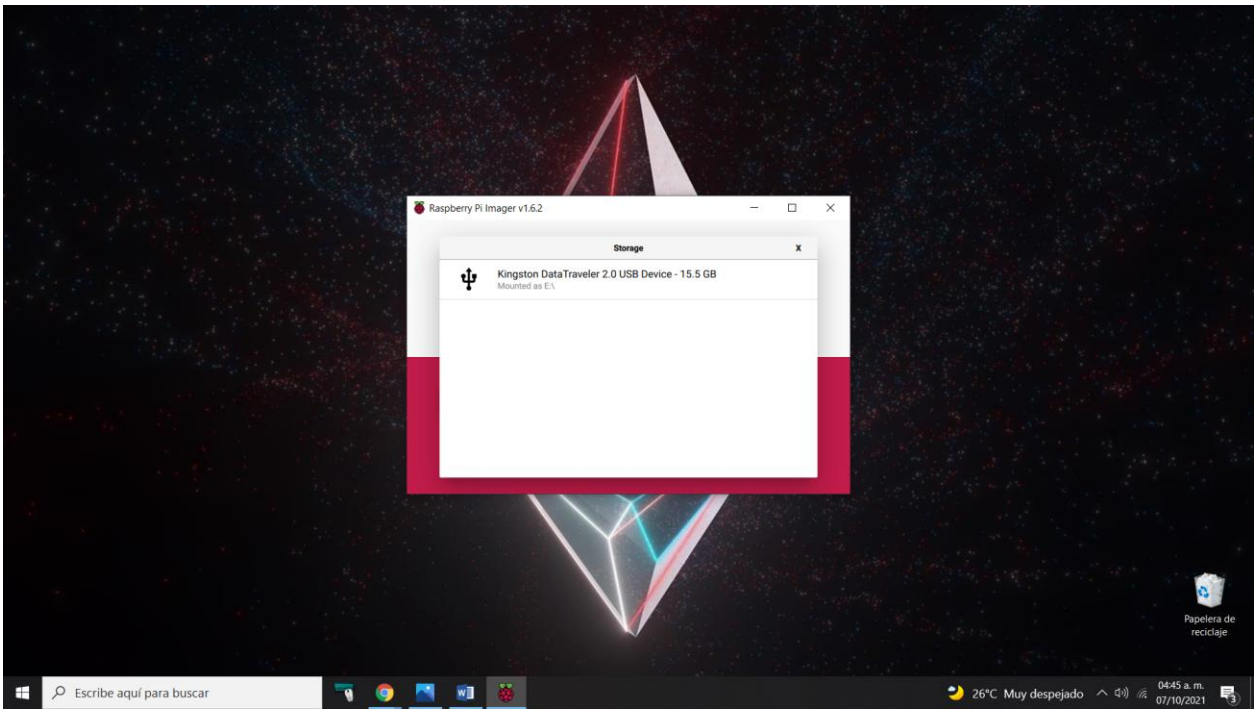

Locate and select CLORELA OS among your downloaded files, then click OPEN.

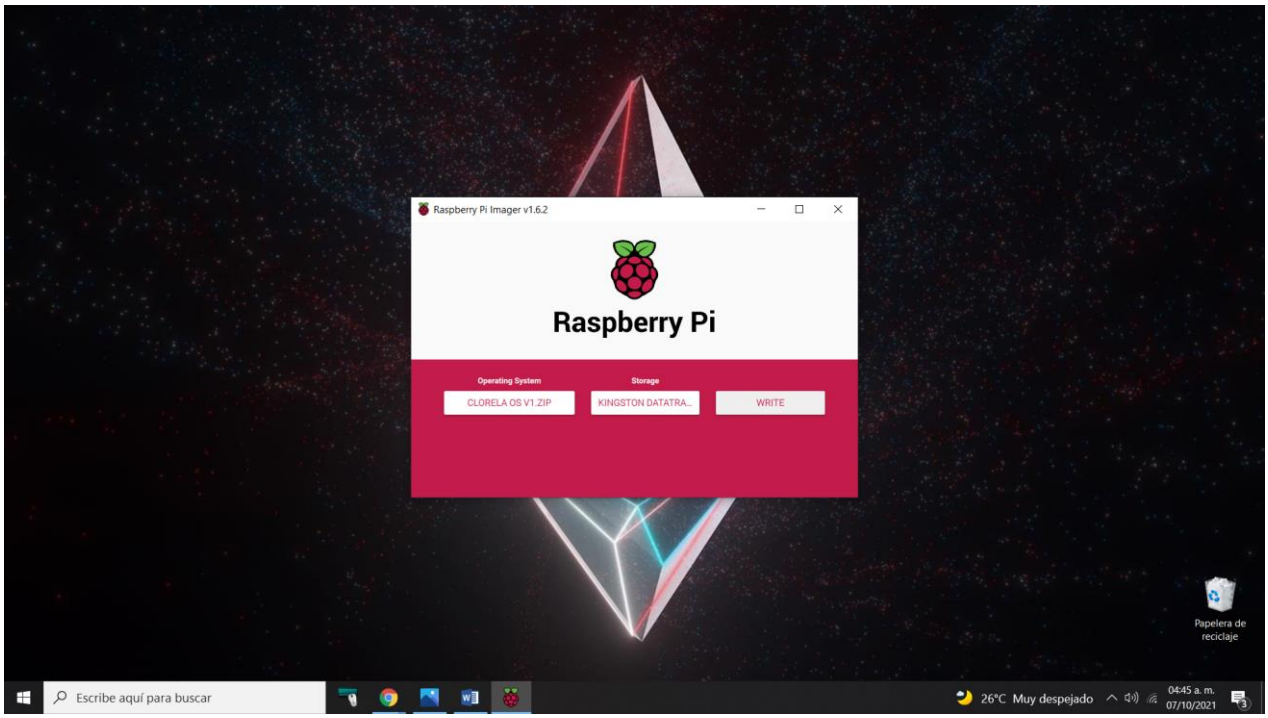

Now the name CLORELA OS will appear inside the button where CHOOSE OS appeared before. Click on the CHOOSE STORAGE button.

Select from your storage devices to the micro SD memory.

Click WRITE to start recording the image.

At the end of the process CLORELA OS will have been recorded in the micro SD memory. Remove the micro SD memory from your computer and insert it into your RASPBERRY-PI ZERO.

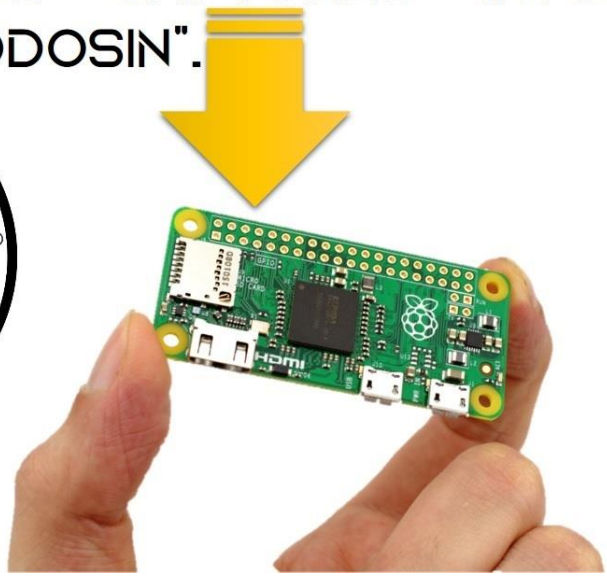

WALCORG

CREATING ECONOMIES BASED ON CARBON CAPTURE

F. A. Q.

What is CLORELA OS?

CHORELLA OS WILL ALLOW YOU TO CONVERT YOUR CO2 CAPTURES INTO "TOKENS" CALLED "CODOSIN".

For Raspberry Pie
Inspired by "eth-OS" .
Powered by Google Compute Engine

There's a physical representation of the token? Yes, and it's for sale.

https://articulo.mercadolibre.com.mx/MLM-908640008-ficha-token-fisico-codosin-coleccion-criptodivisa-_JM

How was made Clorela-OS? Here is a series of tutorials (in spanish) about the creation process: https://youtu.be/jvU4fKmdEkM?si=sEuECjoqBvePfN0e

COMMON ISSUES WITH RASPBERRY PI ZERO.

Did you know that **ALL** Raspberry Pi's are tested before they leave the factory? Therefore, a faulty Raspberry Pi is very rare indeed!

Below are the most common reasons for a Raspberry Pi Zero not to work as expected:

- **Operating System (OS)** - Only the latest OS release will work on the new Raspberry Pi Zero W. You can either grab a pre-installed MicroSD card from our store or download it from the Raspberry Pi website (it will need to be a clean install, **not booted from another model of Raspberry Pi**, else it will not work).
- **Power Supply** - Whilst the Raspberry Pi Zero doesn't need a lot of power, a poor quality power supply or cable can cause endless problems. Avoid using a USB port on your computer/laptop! We recommend the official 5.1V 3A power supply.
- **Poor Quality SD Card** - Unfortunately cheap and 'No name' SD cards are a false economy. The Raspberry Pi forums show many posts with troubled users having issues with their poor quality SD cards. We recommend Panasonic/Sandisk micro-SD cards for the Raspberry Pi - other cards can cause endless issues.
- **SD card missing/not fitted properly** - If your Pi Zero is showing no activity/LED lights at all, 99% of the time this is because the SD card isn't being recognised. Unlike other Raspberry Pis, the Zero will show no lights when no SD card is installed/detected. Take your SD card out and refit. Still not working? Test with another SD card or try to **write a fresh copy of Raspberry Pi OS to the card**.
- **Corrupted SD Card** - Sometimes SD cards corrupt no matter how careful you are. You might spot this if your Pi Zero doesn't boot but you see 8 flashes on the LEDs.
- If you have a micro-SD card reader it takes just a few clicks to reflash the card using Raspberry Pi's imager software on a PC/laptop: https://www.raspberrypi.org/software/
- **Check the Indication LEDs (no lights?)** - the Raspberry Pi indication LEDs can tell you a lot about what is happening with your Raspberry Pi. There's a comprehensive Raspberry Pi forum post on this subject which will assist you, with a Pi Zero specific section here. **No lights?** This almost always means that the SD card probably isn't being detected (see above bullet).
